

ANTI-GRAVITY MODELS FOR EPIDEMIC SPREAD OF INFECTIOUS DISEASES ON LONG DISTANCE TRAVEL NETWORKS

Diána H. Knipl

PhD student

University of Szeged, Hungary

Based on the joint work with G. Röst (U of Szeged) and J. Wu (York U)

BIOMAT 2013 - 13th International Symposium on Mathematical
and Computational Biology, November 04 - 08, 2013, Toronto

Outline

1. Introduction

modeling disease spread on travel networks

2. Model formulation

for influenza and global airline transportation

3. DDE with dynamically defined delay feedback

fundamental properties

4. Reproduction number

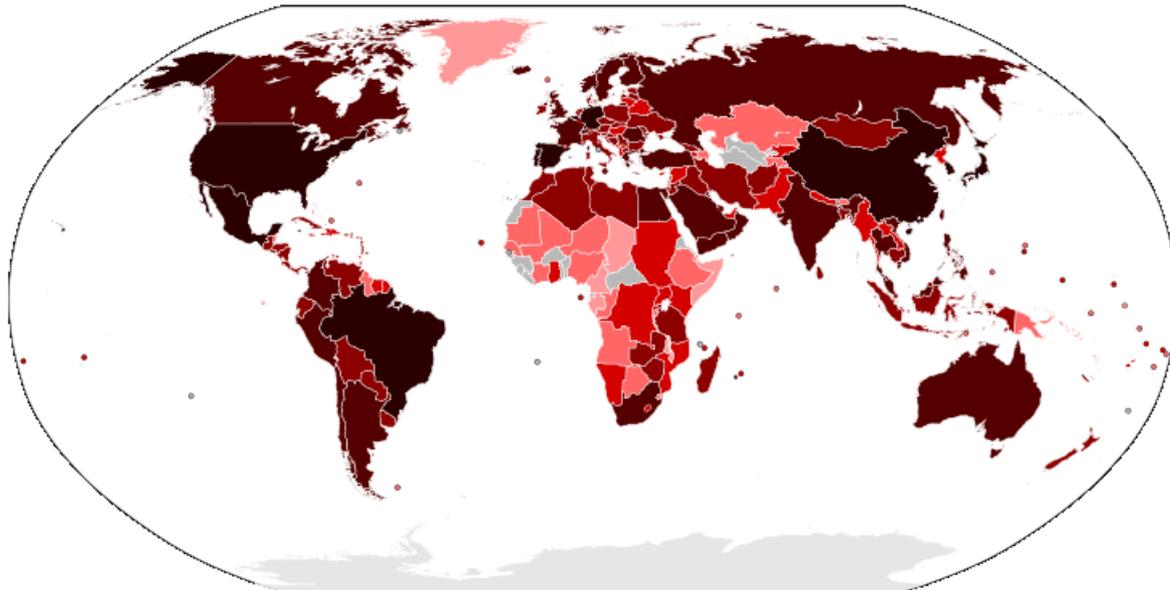

dependence on key model parameters

5. Simulations, datafit

influence of heterogeneity

Pandemic spread of infectious diseases

- Infectious diseases cross national boundaries
- Increased speed of spread to distant territories (air transportation)
- SARS 2002-2003, H1N1 influenza 2009

Modeling on travel networks

- Meta-population models in connecting regions (Arino (2009), Arino & Van den Driessche (2003), Ruan et al (2006), etc)
- Cui et al (2006), Takeuchi et al (2007): Passengers contract the disease while traveling – ODE models

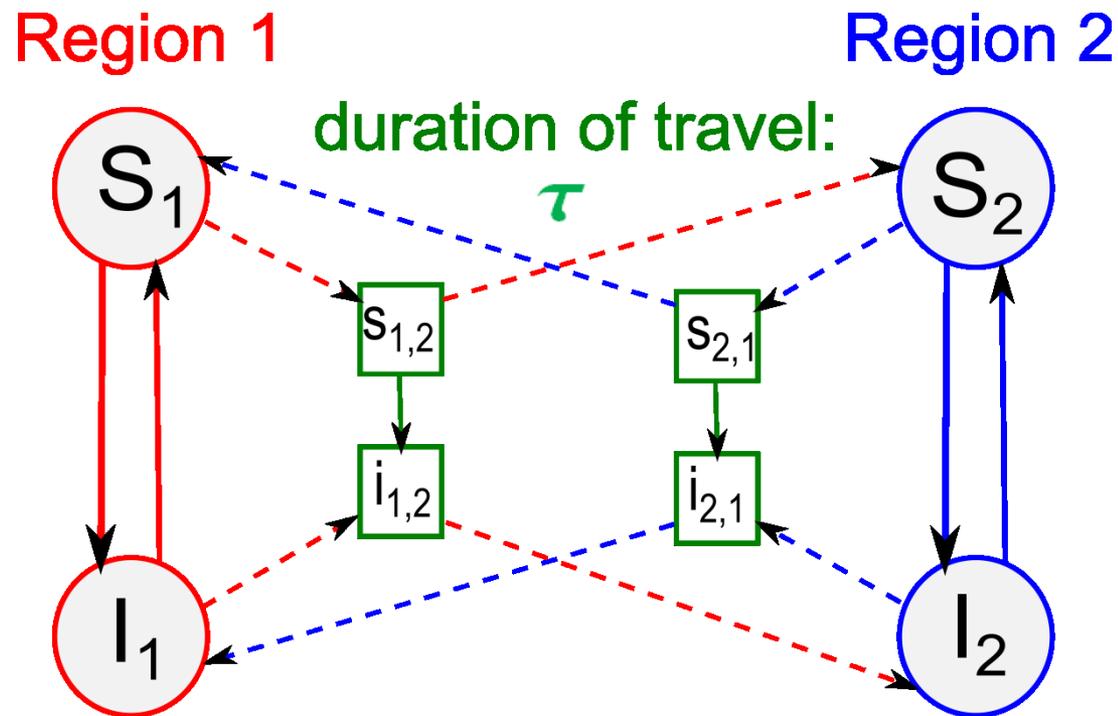

Tuberculosis, measles, seasonal influenza are transmissible during commercial flights (ECDC)

- Liu et al (2008) introduced transportation time and the possible infections during the trip – **DDE models**

Long travel times ($\sim 6 - 14$ h) are not negligible

Fast progressing diseases, even a small delay is significant

SIS-based model for 2 regions with time delay

Outline

1. Introduction

modeling disease spread on travel networks

2. Model formulation

for influenza and global airline transportation

3. DDE with dynamically defined delay feedback

fundamental properties

4. Reproduction number

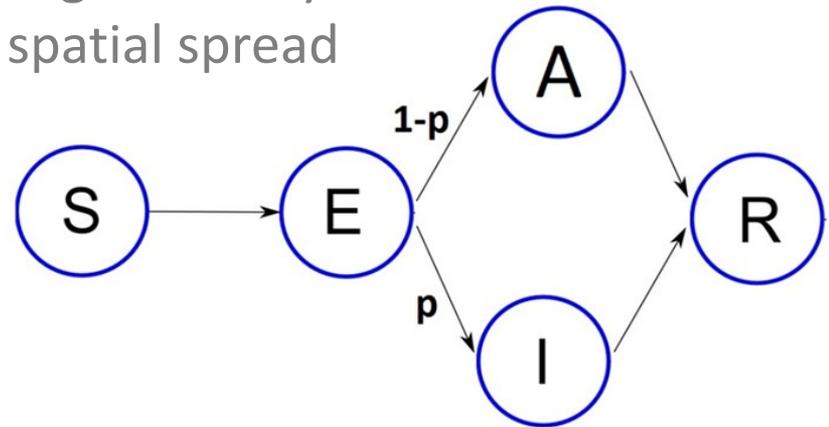

dependence on key model parameters

5. Simulations, datafit

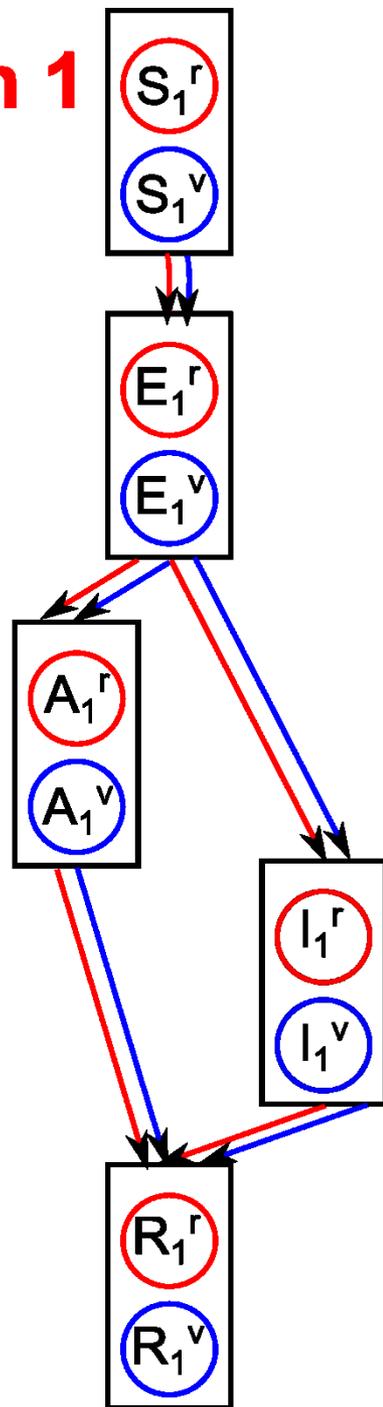

influence of heterogeneity

Adapting the model to influenza

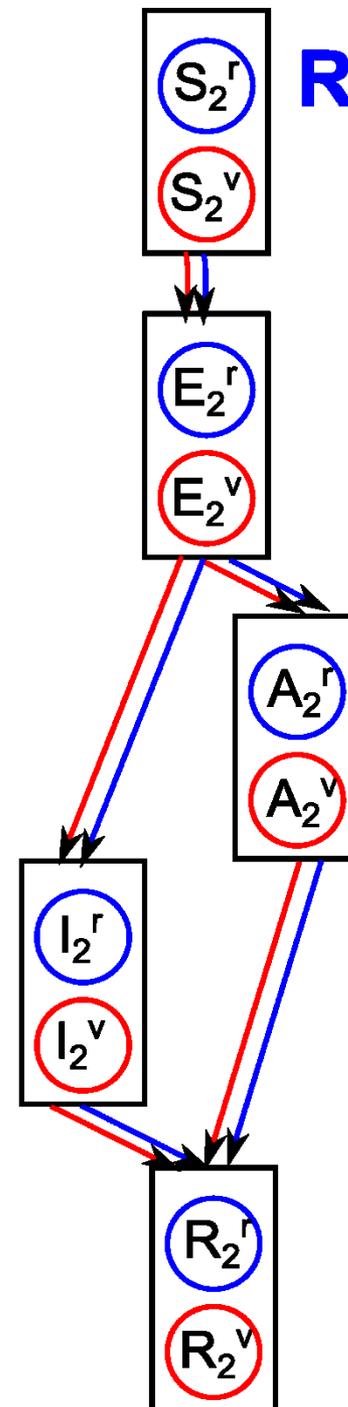

- For most diseases which cause global pandemics, an SIS-type model is not adequate -> **SEAIR model**
- Antygravity-type model
 - the longer the flight, the more infections on-board
- Distinguish local residents from temporary visitors
 1. Number of visitors, average visiting time may significantly affect the speed of spatial spread
 2. Visitors and residents can have different mixing patterns, contact rates

 \dot{I}_1^r(t) = p\mu_E E_1^r - (d_1^r + \delta + \mu_I)I_1^r(t) & -\alpha_1 I_1^r(t) + i_{2,1}^v(\tau, t - \tau), \\
 \dot{R}_1^r(t) = \mu_I I_1^r(t) + \mu_A A_1^r(t) - d_1^r R_1^r(t) & -\alpha_1 R_1^r(t) + r_{2,1}^v(\tau, t - \tau), \\
 \\
 \dot{S}_1^v(t) = -S_1^v(t)F_1^v(t) - d_1^v S_1^v(t) & -\gamma_1 S_1^v(t) + s_{2,1}^r(\tau, t - \tau), \\
 \dot{E}_1^v(t) = S_1^v(t)F_1^v(t) - (d_1^v + \mu_E)E_1^v(t) & -\gamma_1 E_1^v(t) + e_{2,1}^r(\tau, t - \tau), \\
 \dot{A}_1^v(t) = (1 - p)\mu_E E_1^v(t) - (d_1^v + \mu_A)A_1^v(t) & -\gamma_1 A_1^v(t) + a_{2,1}^r(\tau, t - \tau), \\
 \dot{I}_1^v(t) = p\mu_E E_1^v(t) - (d_1^v + \delta + \mu_I)I_1^v(t) & -\gamma_1 I_1^v(t) + i_{2,1}^r(\tau, t - \tau), \\
 \dot{R}_1^v(t) = \mu_I I_1^v(t) + \mu_A A_1^v(t) - d_1^v R_1^v(t) & -\gamma_1 R_1^v(t) + r_{2,1}^r(\tau, t - \tau)
 \end{array} \right.$$

- The dynamics during travel is described by an SEAIR-based model. No closed form solution.
- No explicit formula for the inflow terms.

Outline

1. Introduction

modeling disease spread on travel networks

2. Model formulation

for influenza and global airline transportation

3. DDE with dynamically defined delay feedback

fundamental properties

4. Reproduction number

dependence on key model parameters

5. Simulations, datafit

influence of heterogeneity

DDE system with dynamically defined delay feedback

- The model is equivalent to a large system of DDEs

$$(1) \begin{cases} x'(t) = \mathcal{F}(x(t), x(t - \tau)) = f(x(t)) + W(x(t - \tau)), \\ x_0 = \varphi, \end{cases}$$

where $t \in \mathbb{R}$, $t \geq 0$, $x : \mathbb{R} \rightarrow \mathbb{R}^{20}$, $f, W : \mathbb{R}^{20} \rightarrow \mathbb{R}^{20}$

- Not a common DDE system: the delay terms require the solution of another differential equation system

$$\begin{cases} y'(s) = g(y(s)), \\ y(0) = y_*, \end{cases}$$

where $s \in \mathbb{R}$, $s \geq 0$, $y : \mathbb{R} \rightarrow \mathbb{R}^{20}$, $g : \mathbb{R}^{20} \rightarrow \mathbb{R}^{20}$ and

$$W(z) := y(\tau, 0; h(z)),$$

where $z \in \mathbb{R}^{20}$ and $h : \mathbb{R}^{20} \rightarrow \mathbb{R}^{20}$

Fundamental properties of system (1)

1. Existence and uniqueness of solution
2. Boundedness and nonnegativity of solution

Reproduction number: average number of new infections generated by 1 exposed individual introduced into a wholly susceptible population

3. The unique DFE is asymp. stable (unstable) if $R_0 < 1$ ($R_0 > 1$)
4. In the disease free subspace the DFE is GAS

Outline

1. Introduction

modeling disease spread on travel networks

2. Model formulation

for influenza and global airline transportation

3. DDE with dynamically defined delay feedback

fundamental properties

4. Reproduction number

dependence on key model parameters

5. Simulations, datafit

influence of heterogeneity

Reproduction number

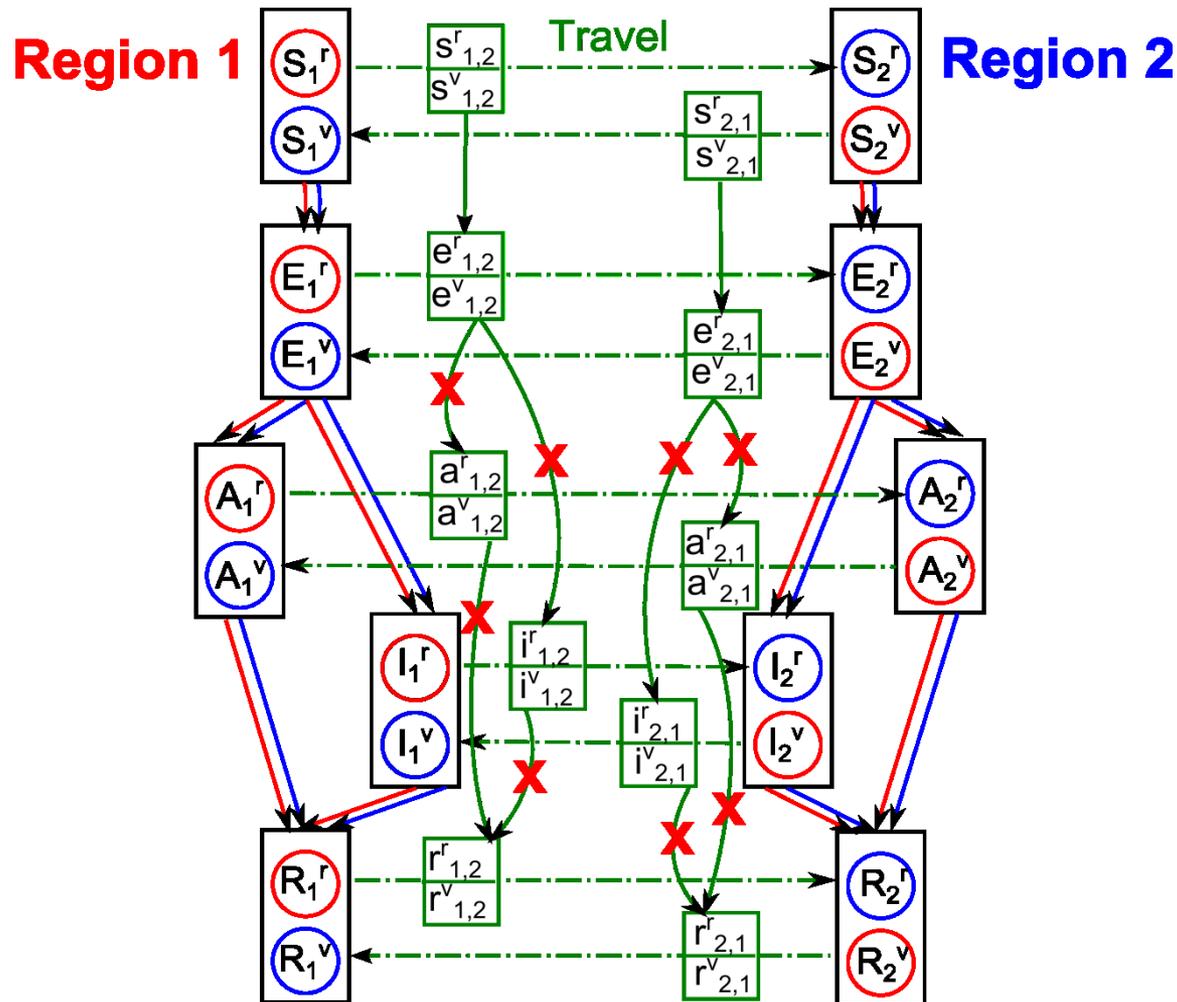

- Average number of new infections generated by 1 exposed individual introduced into a wholly susceptible population
- In absence of travel: local reproduction numbers are easy to obtain

$$\mathcal{R}_{L,1} = \beta_1^{rr} \left(\frac{p}{\mu_I} + (1-p) \frac{\rho}{\mu_A} \right), \mathcal{R}_{L,2} = \beta_2^{rr} \left(\frac{p}{\mu_I} + (1-p) \frac{\rho}{\mu_A} \right)$$

$$\mathcal{R}_0 = \max\{\mathcal{R}_{L,1}, \mathcal{R}_{L,2}\}$$

- With travel dynamics, unlimited # of travels: very complicated

- The period of travel is relatively short (~ 12 hours).
- ASSUMPTION: no movement from E to I, A (1.4 days), from I, A to R (3 days / 4.1 days)

Next generation matrix

- 4 types of individuals:
resident / visitor in region 1 / 2
- 4x4 next generation matrix
- R_0 : dominant eigenvalue of NGM

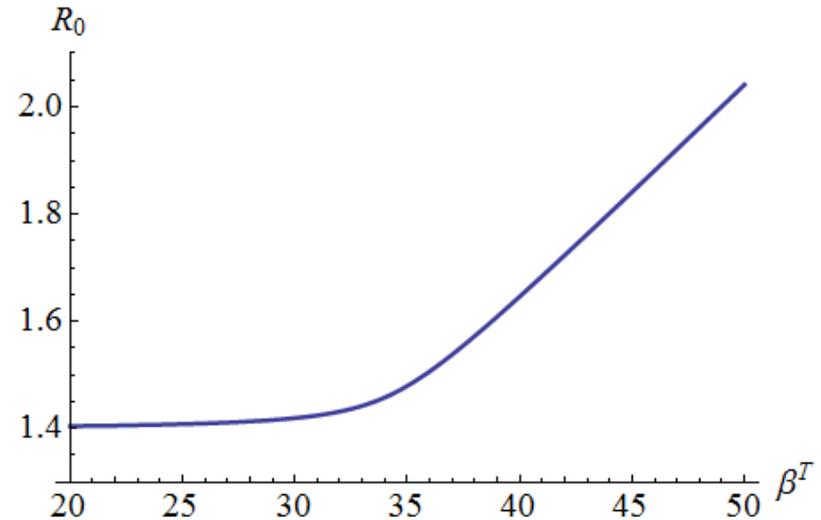

$$NGM = \begin{pmatrix} R_{11}^{rr} & R_{11}^{vr} & R_{21}^{rr} & R_{21}^{vr} \\ R_{11}^{rv} & R_{11}^{vv} & R_{21}^{rv} & R_{21}^{vv} \\ R_{12}^{rr} & R_{12}^{vr} & R_{22}^{rr} & R_{22}^{vr} \\ \boxed{R_{12}^{rv}} & R_{12}^{vv} & R_{22}^{rv} & R_{22}^{vv} \end{pmatrix}$$

Each element of this NGM is complicated to find.

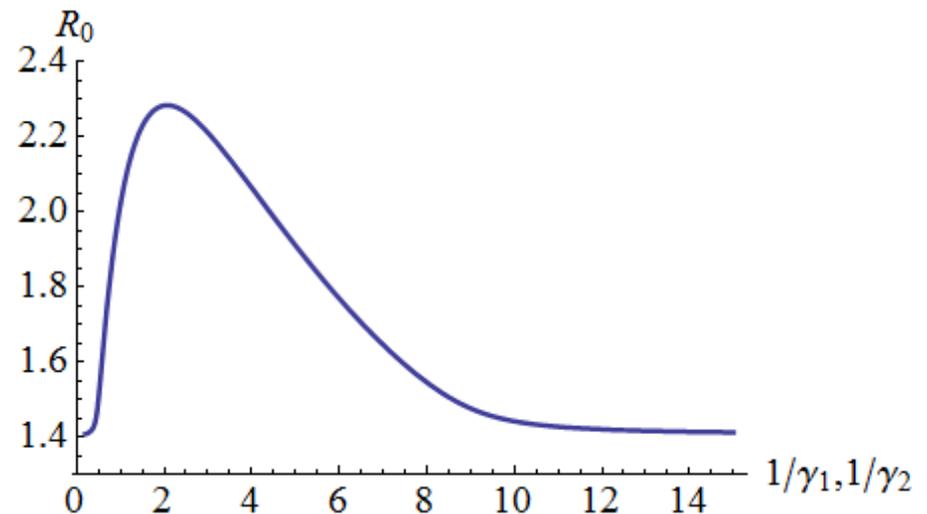

$$\begin{aligned}
R_{12}^{rv} = & p \left(\frac{\mu_E \alpha_1}{(\alpha_1 + \mu_E + d_1^r)(\gamma_2 + \mu_E + d_2^v) - \alpha_1 \gamma_2} \right. \\
& \frac{(\gamma_2 + \mu_E + d_2^v)(\gamma_2 + \mu_I + \delta + d_2^v) + \alpha_1 \gamma_2}{(\alpha_1 + \mu_I + \delta + d_1^r)(\gamma_2 + \mu_I + \delta + d_2^v) - \alpha_1 \gamma_2} \tau \beta^T \frac{\alpha_1 \hat{N}_1^r}{\gamma_1 \hat{N}_1^v + \alpha_1 \hat{N}_1^r} \\
& + \frac{\mu_E \alpha_1}{(\alpha_1 + \mu_E + d_1^r)(\gamma_2 + \mu_E + d_2^v) - \alpha_1 \gamma_2} \\
& \left. \frac{\gamma_2 + \mu_E + d_2^v + \alpha_1 + \mu_I + \delta + d_1^r}{(\alpha_1 + \mu_I + \delta + d_1^r)(\gamma_2 + \mu_I + \delta + d_2^v) - \alpha_1 \gamma_2} \beta_2^{vv} \frac{\hat{N}_2^v}{\hat{N}_2^r + \hat{N}_2^v} \right) \\
& + (1 - p) \left(\frac{\mu_E \alpha_1}{(\alpha_1 + \mu_E + d_1^r)(\gamma_2 + \mu_E + d_2^v) - \alpha_1 \gamma_2} \right. \\
& \frac{(\gamma_2 + \mu_E + d_2^v)(\gamma_2 + \mu_A + d_2^v) + \alpha_1 \gamma_2}{(\alpha_1 + \mu_A + d_1^r)(\gamma_2 + \mu_A + d_2^v) - \alpha_1 \gamma_2} \tau \rho \beta^T \frac{\alpha_1 \hat{N}_1^r}{\alpha_1 \hat{N}_1^r + \gamma_1 \hat{N}_1^v} \\
& + \frac{\mu_E \alpha_1}{(\alpha_1 + \mu_E + d_1^r)(\gamma_2 + \mu_E + d_2^v) - \alpha_1 \gamma_2} \\
& \left. \frac{\gamma_2 + \mu_E + d_2^v + \alpha_1 + \mu_A + d_1^r}{(\alpha_1 + \mu_A + d_1^r)(\gamma_2 + \mu_A + d_2^v) - \alpha_1 \gamma_2} \rho \beta_2^{vv} \frac{\hat{N}_2^v}{\hat{N}_2^r + \hat{N}_2^v} \right).
\end{aligned}$$

Dependence of R_0 on key model parameters

- Increasing in terms of the transmission rates, infectious periods

- Non-monotonic behaviour in the duration of visitors' stay

Exposed period: 1.4 days

Infectious period: 3 - 4.1 days

Pandemic preparation – imported cases

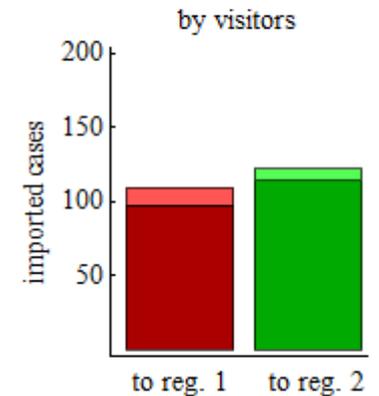

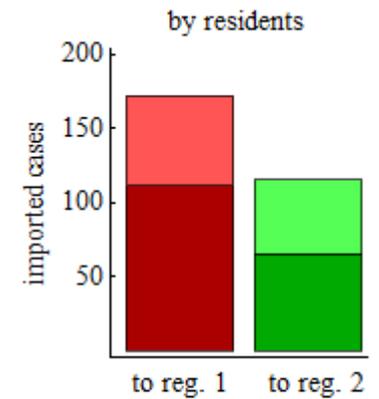

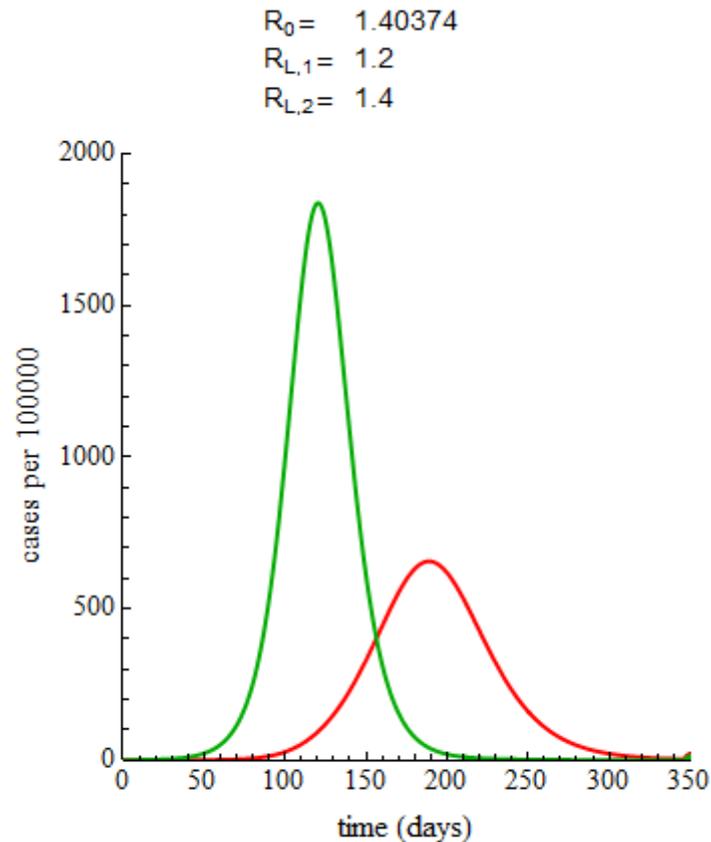

- Regions symmetric in ep. parameters, population size etc.
- Except reproduction numbers:

$R_1=1.2$ (DF at Day 0)

$R_2=1.4$ (source)

$\alpha_1=5 \cdot 10^{-5}$ (~55 yrs)

$\alpha_2=5 \cdot 10^{-5}$

Pandemic preparation – imported cases

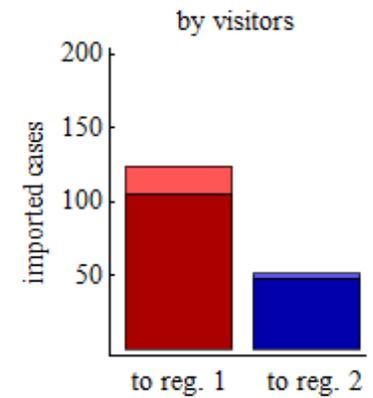

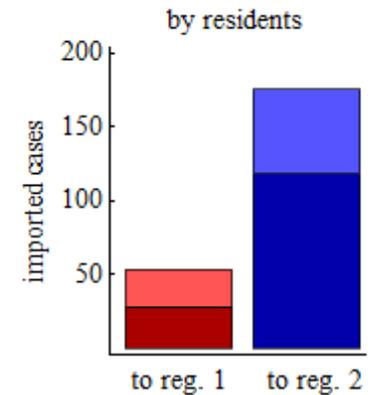

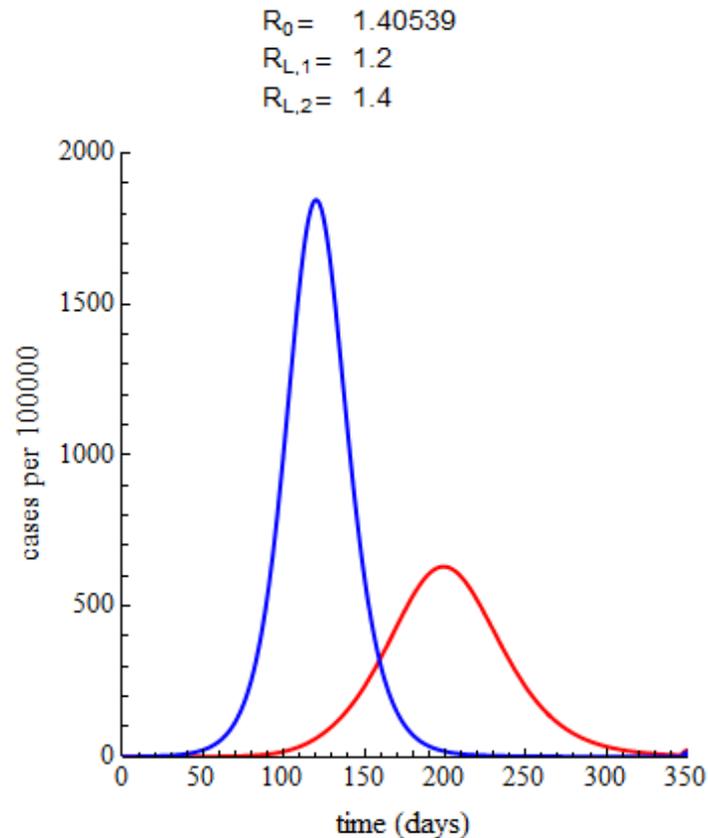

- Regions symmetric in ep. parameters, population size etc.
- Except reproduction numbers & travel rates

$R_1=1.2$ (DF at Day 0)

$R_2=1.4$ (source)

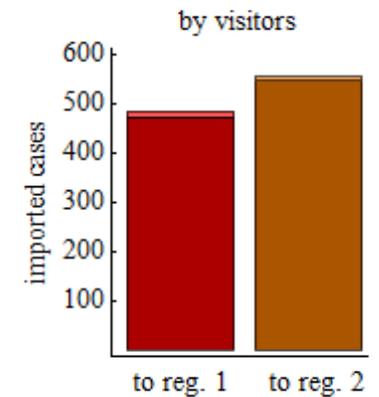

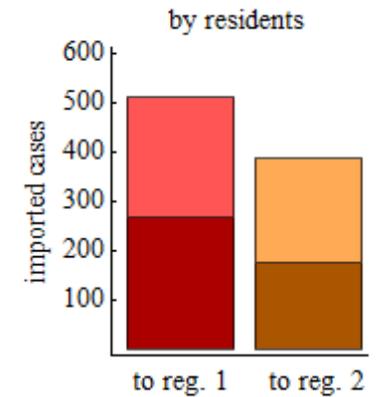

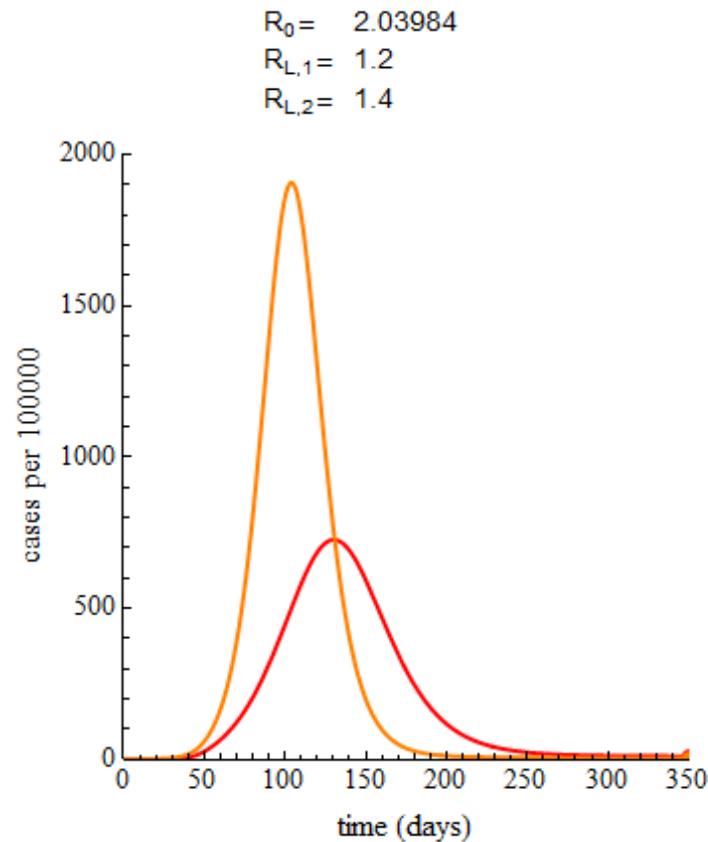

$\alpha_1=2 \cdot 10^{-5}$ (~137 yrs)

$\alpha_2=8 \cdot 10^{-5}$ (~34 yrs)

Pandemic preparation – imported cases

- Regions symmetric in ep. parameters, population size etc.
- Except reproduction numbers:
 $R_1=1.2$ (DF at Day 0)
 $R_2=1.4$ (source)
- $\alpha_1=5 \cdot 10^{-5}$ (~55 yrs)
 $\alpha_2=5 \cdot 10^{-5}$
- Elevated transm. rate during travel

Outline

1. Introduction

modeling disease spread on travel networks

2. Model formulation

for influenza and global airline transportation

3. DDE with dynamically defined delay feedback

fundamental properties

4. Reproduction number

dependence on key model parameters

5. Simulations, datafit

influence of heterogeneity

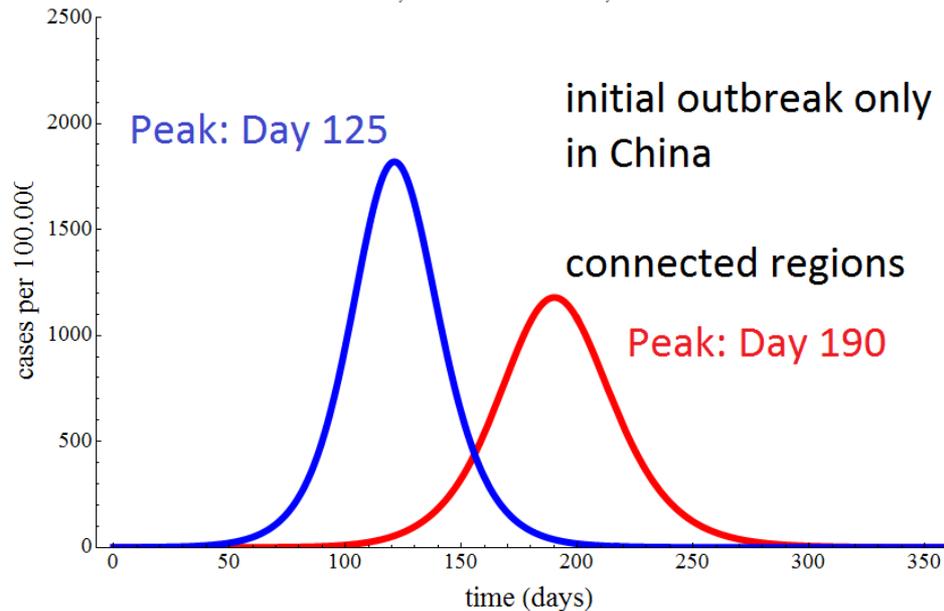

Simulations

- Reasonable values for epidemiological parameters
- Real demographic and air traffic data (Bio.Diaspora project, Arino *et al*)
- Three distinct scenarios for the regions:
 - ❖ **Canada-UK** („symmetric“)
 - ❖ **Canada-China** („asymmetric population“)
 - ❖ **Canada-Mexico** („asymmetric travel“)
- Questions of interest
 - ❖ effect of travel restrictions
 - ❖ effect of elevated transmission potential during travel
 - ❖ impact of visit durations
 - ❖ fitting the model to real morbidity data

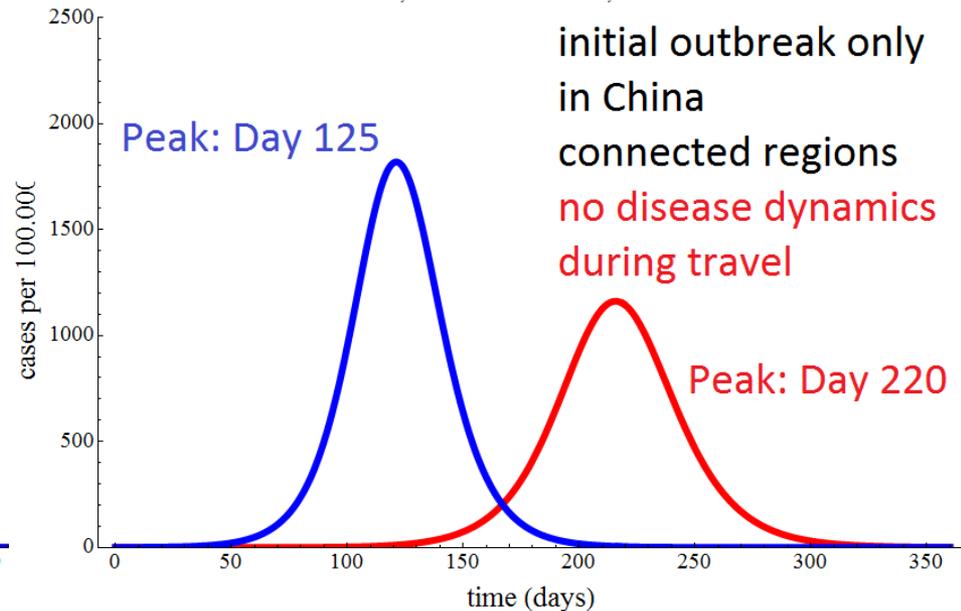

Canada – China

- Impact of disease transmission during travel
- Ignoring the possibility of on-board transmission overestimates the time for preparation before the outbreak

$$R_0 = 1.40005$$
$$R_{L,1} = 1.3 \quad R_{L,2} = 1.4$$

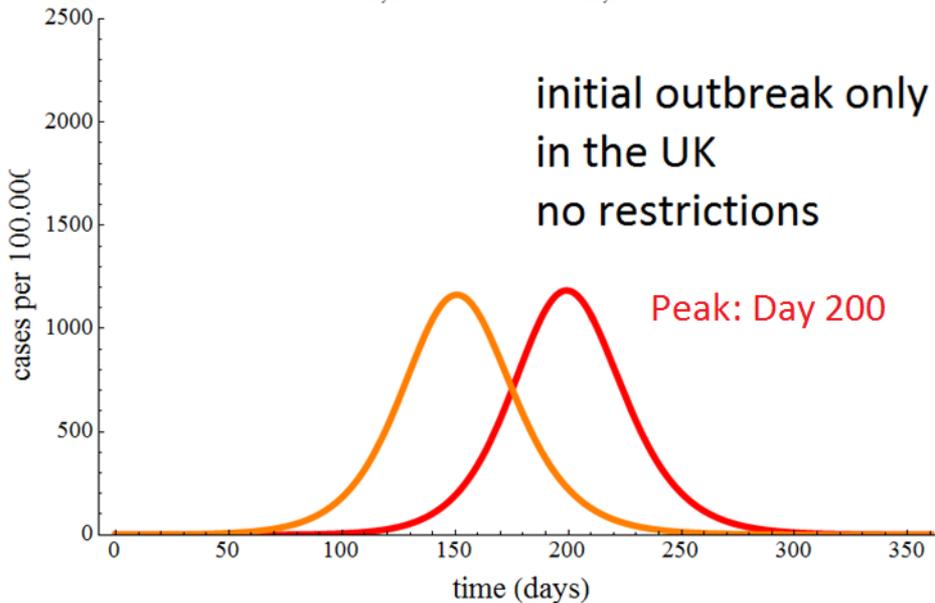

$$R_0 = 1.39994$$
$$R_{L,1} = 1.3 \quad R_{L,2} = 1.4$$

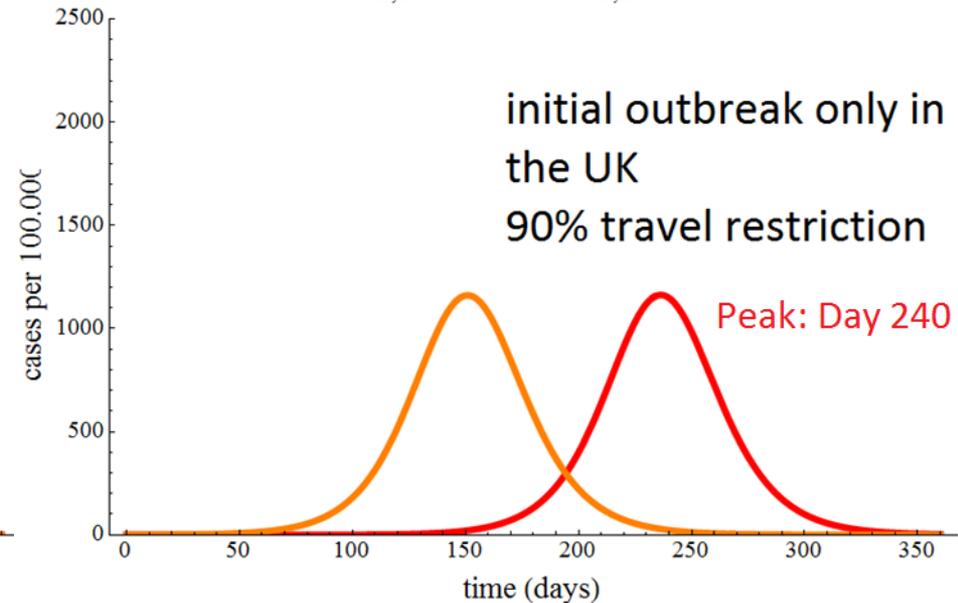

Canada – United Kingdom

- UK produces ~7% of all air traffic to Canada
- Effect of reduction of traveling by 90%

$$R_0 = 1.30206$$
$$R_{L,1} = 1.3 \quad R_{L,2} = 1.3$$

$$R_0 = 1.30021$$
$$R_{L,1} = 1.3 \quad R_{L,2} = 1.3$$

Canada – Mexico

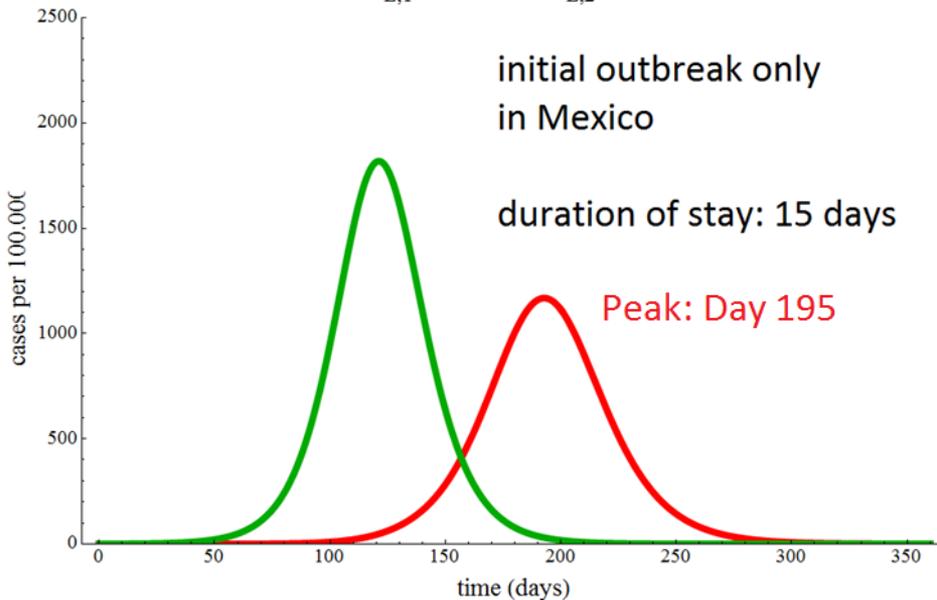

- Visitors stay for 7 days on average
- Impact of lengthening vs. shortening this time

$$R_0 = 1.39996$$
$$R_{L,1} = 1.3 \quad R_{L,2} = 1.4$$

initial outbreak only
in Mexico

duration of stay: 15 days

Peak: Day 195

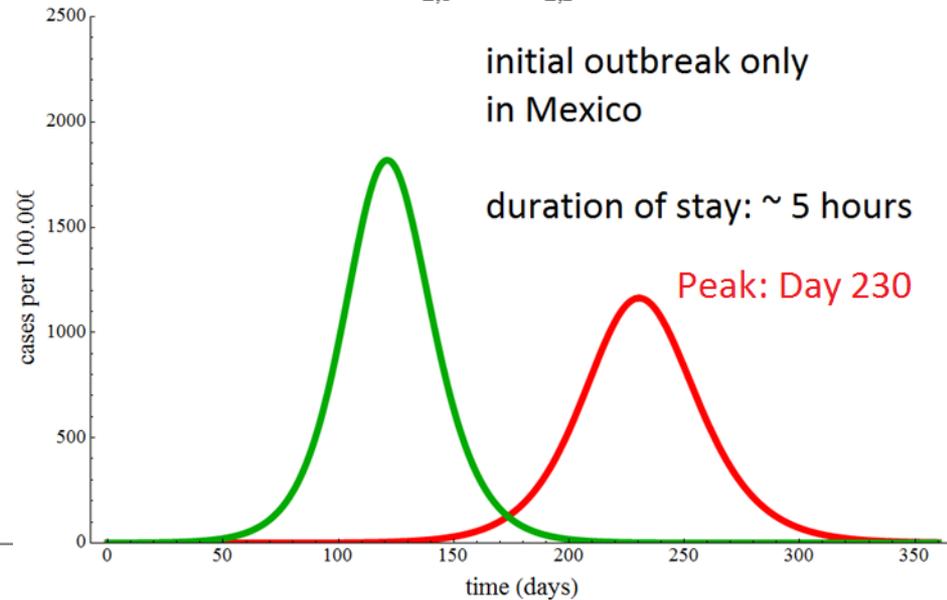

$$R_0 = 1.4$$
$$R_{L,1} = 1.3 \quad R_{L,2} = 1.4$$

initial outbreak only
in Mexico

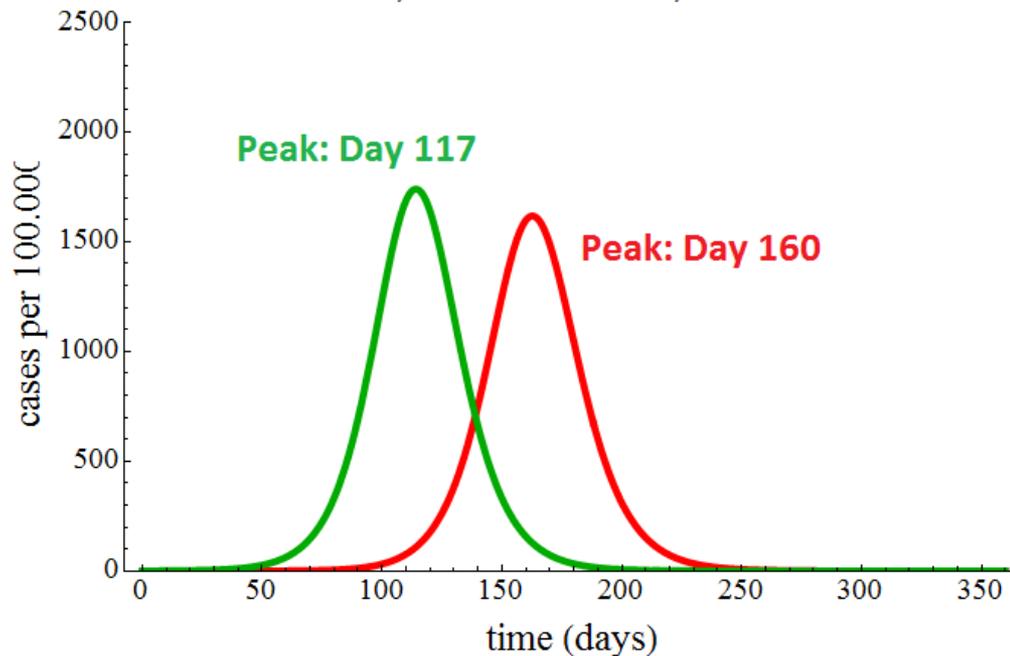

duration of stay: ~ 5 hours

Peak: Day 230

Fitting the model to the 1st wave of the H1N1 2009

$$R_0 = 1.39997$$
$$R_{L,1} = 1.38 \quad R_{L,2} = 1.4$$

Local R in **Mexico**: 1.4

Local R in **Canada**: 1.38

Peak time in **Mexico**:

Day 117-123

Peak time in **Canada**:

Day 155-162

(Day 0: Decemeber 31, 2008)
